Nov.09.2020

- To run the Garfield, we need to prepare the setting files RTPC.geo, and RTPC.sif, and the software Gmsh and Elmer.
  - Gmsh can construct the grids of the geometry with the RTPC.geo, and the output file is RTPC.msh
  - Elmer can help to define the electric potential of the grids with the files RTPC.msh and RTPC.sif. The output file would be RTPC.result.
- Garfield is constructed for Bonus by Nate, and therefore we can compile the code to get the executable file which can simulate the drift region in RTPC. The output file is a root file format.
- Run the analysis code done by Nate, we can get the parameter of fit equations.

- Observed:
  - There is a new output file RTPC.msh with running the new Gmsh version.
  - Same RTPC.msh file can produce almost same results when getting the information of the electric potential in RTPC.
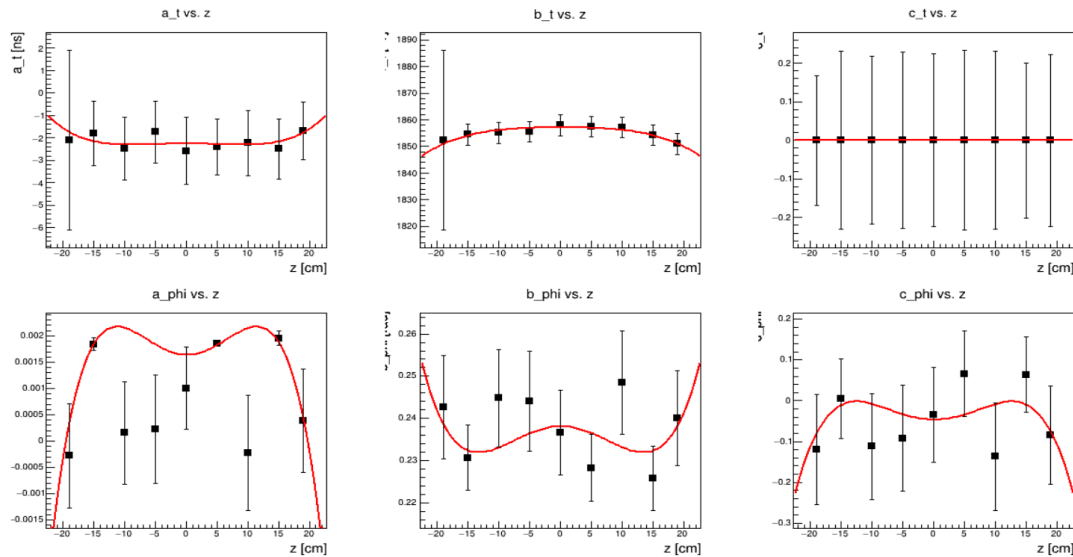

Parameter

- Potential Settings:
  - Electric potential : V_cathode = -4058V
  - B-field : 1.0 T
  - Pressure = 760 torr
  - Gas-Mixture = 80:20 He:CO_2
  - Temp = 293 K
- Link of comparing results: https://userweb.jlab.org/~nathand/rgf/parameters/rgf_sum_cosmics/4p0/index.html
